## **DETAILED ACTION**

This is a first office action on the merits of patent application S. N. 10/773,657.

### ***Priority***

Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

### ***Claim Rejections - 35 USC § 112***

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 9-15 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The description of examples or preferences in the claim ("in particular" – claim 9, line 4) leads to confusion over the intended scope of the claim.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 9-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Allen et al. ('417) in view of JP ('906).

Allen et al. discloses a hydrodynamic torque converter (Fig. 1) comprising a clutch (27), a drive/housing (16), a pump impeller wheel (12), a turbine rotor (13), a controllable actuation device (28), an aperture (Fig. 1), a positionally fixed component (Fig. 1) with a rotary connection, a pressure feed line (Fig. 1), and a coolant feed line (Fig. 1). Allen et al. does not show a pressure sensor.

However, the practice of using sensors for controlling torque converter clutches and/or clutches in general is very common in the art. For example, JP discloses a torque converter (Fig.) comprising a stationary internal pressure sensor, a pressure line (17), a tapping point (14a), and a control unit (7). Then, it would have been obvious to a

person of ordinary skill in the art at the time the invention was made to provide a pressure sensor in the device of Allen et al. in view of JP to monitor the operating conditions within the torque converter.

### ***Conclusion***

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Kashiwara ('159) discloses another control device for a torque converter clutch having a pressure sensor (58). Olson et al. ('964), Gibbs ('157), Brandt et al. ('333), Fonkalsrud et al. ('581), Creger (242), Leber ('207, '209) disclose other hydrodynamic torque converters having impeller clutches.
